- b ] Gender Equality and the Indian Society
- c ] Protection of the Environment

VIII. Write a précis of the following passage

[8 marks]

Science has affected our everyday life in innumerable ways. It has revolutionized transport and communications and made the world smaller. It has also made the world a better place to live in. We have well-lighted cities with good sanitation. Science has provided all kinds of new substances and machines and sources of power. There is almost no end to

the benefits that science has conferred on us. All the same, the work of science is no unmixed blessing. Scientific industry is recklessly exploiting the new materials of the earth. Science has rendered life in cities less healthy. The over-crowding in cities, the air pollution largely because of smoke, cheap food deficient in vitamins—these are all dangerous to health. Again, people in big cities are denied sunlight, fresh air and exercise. Science also has to take up the problem of social life itself. It has to work for freedom from war and various social and economic evils. Science can deal with these human affairs. There would be fewer follies, and happiness and good feeling would prevail all around if we apply the scientific attitude to all our affairs. Properly using science and cultivating the scientific spirit, man can control his destiny.
